Amendments to the Specification

Please amend Paragraph [57] as follows:

When the supplied source data does not have a parental grade code thereon, a user setting process of a parent grade code or level can be completed. For example, a second parental grade code can be generated as a default value by a command (e.g., preset) based on the detection result (e.g., adult grade). Alternatively, the second parental grade code can be generated as a value set by a user based on the detection result. However, the present invention is not intended to be so limited. For [[Fro]] example, the second parental grade code can be generated and include added information or increased granularity even when the first parental grade code is detected.
